Rituximab therapy in rheumatoid arthritis and primary biliary cholangitis

Terapia con Rituximab en artritis reumatoide y colangitis biliar primaria

To the Editor,

The prevalence of rheumatoid arthritis (RA) has been reported to be 1.8% in patients with primary biliary cholangitis (PBC), and mitochondrial antibodies (AMA) have been found in 10% of RA patients.^{1,2} It was reported that T and B cells play an important role in the inflammatory process of both RA and PBC.^{3,4} The potential therapeutic target is determined by the pathogenetic mechanism. We report a case series of patients with RA and PBC with good clinical response to rituximab.

The first case was a 61-year-old female with the diagnosis of RA and PBC. The serological tests were negative, except for rheumatoid factor (RF), anti-cyclic citrullinated peptide antibodies (anti-CCP) and AMA-M2. Serum lipids, glucose, renal function tests, parathyroid-thyroid hormones, viral markers and protein electrophoresis pattern were normal. Abdominal ultrasonography showed no pathology. She had a medical history of smoking and receiving ursodeoxycholic acid (15 mg/kg/day), methotrexate (MTX, 15 mg/week), hydroxychloroquine (200 mg/day) and methylprednisolone (4–8 mg/day). Due to high disease activity (DAS-28: 6.24) rituximab (1000 mg IV every 2 weeks) was administered.

The second case was a 68-year-old female with the diagnosis of RA and PBC. She had medical history of using ursodeoxycholic acid (10 mg/kg/day), leflunomide (20 mg/day), hydroxychloroquine (200 mg/day) and prednisone (10 mg/day). She had a RF of 34.2 U/mL (3–18 IU/mL) and anti-CCP of 8.7 U/mL (0–4.99 U/mL). AMA-M2 was positive and viral serology was negative. Abdominal ultrasonography showed no pathology. Due to exacerbation of

arthritis and high disease activity, rituximab (1000 mg IV every 2 weeks) was administered.

Changes in laboratory findings of 2 cases are shown in Table 1.

Hepatic involvement is rare, and not common in RA. Hepatic abnormalities are generally associated with hepatotoxic drugs, viral hepatitis and alcoholic cirrhosis.^{5,6} AMA, which have an important role in PBC pathogenesis, are useful indicators for liver diseases (PBC) in RA. B-cells, T-cells, and TNF- α have been implicated in the pathogenesis of PBC.^{3,4} B-cells may contribute to pathogenesis with immunoglobulin production, bile ducts destruction and regulatory function. It suggests that B-cells and immunoglobulins are important and B-cell depletion may be a promising therapy for PBC.^{3,4} Lazrak et al. reported combination therapy with MTX and rituximab in a 60-year-old RA and PBC patient.⁷ There was a good clinical response for RA, but abnormal liver function tests were found on the 5th month of therapy. Exacerbation and development of PBC with B cell depletion in mice was reported.^{8,9} Tsuda et al. reported 6 PBC patients treated with rituximab due to the suboptimal response to UDCA.³ The study showed that rituximab reduced B cells, AMA, alkaline phosphatase, IgG, IgM, and IgA. It has been reported the improvement in liver laboratory parameters with rituximab, but not the improvement in symptoms such as fatigue. According to Myers et al., the levels of ALP, IgM, and AMA were significantly decreased at 6 months of rituximab in patients with PBC and incomplete response to ursodeoxycholic acid.¹⁰ At 12 months of treatment, the fatigue was the same, and 60% of patients had a reduction in itching. We described 2 cases with RA and PBC who had a good clinical response to rituximab. The activity of both diseases and abnormal hepatic tests returned to normal levels after therapy. However, reduction in the progression of disease and cirrhosis is unclear.

Clinicians should be aware of hepatic diseases in patients with RA. It should be kept in mind that AMA is useful for the diagnosis of PBC in RA patients with abnormal hepatic tests. Rituximab was tolerable in RA patients with PBC. However, further studies in

Table 1
Laboratory features of patients with rheumatoid arthritis and primary biliary cholangitis.

Case 1	Before rituximab	On the 6th month	Case 2	Before rituximab	On the 6th month
DAS-28	6.24	2.79	DAS-28	5.99	3.15
AST	25 U/L	14 U/L	AST	25 U/L	19 U/L
ALT	21 U/L	11 U/L	ALT	19 U/L	10 U/L
ALP	209 U/L	132 U/L	ALP	156 U/L	70 U/L
GGT	254 U/L	34 U/L	GGT	33 U/L	20 U/L
ESR	75 mm/h	27 mm/h	ESR	81 mm/h	23 mm/h
CRP	22.1 mg/L	8.1 mg/L	CRP	32.4 mg/L	8.31 mg/L
IgG	877 mg/dL	756.6 mg/dL	IgG	1847.5 mg/dL	1346.3 mg/dL
IgM	232.3 mg/dL	132.9 mg/dL	IgM	361.1 mg/dL	149.4 mg/dL
IgA	157 mg/dL	132.9 mg/dL	IgA	437.7 mg/dL	424.7 mg/dL

DAS-28, disease activity score-28; AST, aspartate aminotransferase; ALT, alanine aminotransferase; ALP, alkaline phosphatase; GGT, gammaglutamyltransferase.
